

Compositionally Different Polymer-Based
Sensor Elements And Methods For Preparing Same
Abstract

The present invention provides a combinatorial approach
5 for preparing arrays of chemically sensitive polymer-based
sensors which are capable of detecting the presence of a
chemical analyte in a fluid in contact therewith. The
described methods and devices comprise combining varying
ratios of at least first and second organic materials which,
10 when combined, form a polymer or polymer blend that is
capable of absorbing a chemical analyte, thereby providing a
detectable response. The detectable response of the sensors
prepared by this method is not linearly related to the mole
fraction of at least one of the polymer-based components of
15 the sensors, thereby making arrays of these sensors useful
for a variety of sensing tasks.
